Progress Report Number: 3

Student Name: Janvi Arora
Student ID: 300383801
Course: CSIS-4495-002
Team Lead: Janvi Arora

Work Logs

Date	Hours	Description of Work Done
Mar 4, 2026	1.5	I reviewed the existing module flow after completing Progress Report 2 and corrected several routing and naming inconsistencies across the modules and navigation files.
Mar 4, 2026	2.0	I fixed the module navigation logic so the “Back to Modules” button and sequential module unlocking worked correctly across Phishing, Password Security, and Social Engineering.
Mar 5, 2026	2.0	I planned the expansion of the training platform by designing three additional modules: Multi-Factor Authentication, Safe Browsing, and Incident Reporting.
Mar 5, 2026	2.0	I updated modulesData.jsx and dashboard progress logic to support the new six-module learning path.
Mar 6, 2026	2.0	I implemented the Multi-Factor Authentication module including lesson content, scenarios, quiz logic, scoring, and completion tracking.
Mar 6, 2026	2.0	I implemented the Safe Browsing module with scenario-based activities, quiz scoring, and integration with the progress system.
Mar 7, 2026	2.0	I implemented the Incident Reporting module including practical scenarios and quiz questions to reinforce reporting procedures.
Mar 7, 2026	1.5	I Refined existing modules (Phishing, Passwords, Social Engineering) to ensure consistent layout, navigation, and scoring behavior.

Date	Hours	Description of Work Done
Mar 8, 2026	2.0	Here I added answer feedback to modules so users now see whether their answer is correct or incorrect along with a short explanation before moving to the next question.
Mar 8, 2026	1.5	I updated the dashboard so progress tracking reflects all six modules and improved the logic that recommends the next learning module.
Mar 9, 2026	1.5	And performed testing across all modules to confirm scoring, unlock progression, navigation, and results calculation worked properly.
Mar 9, 2026	1.0	Began drafting Progress Report 3 and reviewed the template to ensure the report follows the required structure.

Summary

During this reporting period, I was mainly focused on expanding the CyberAware training platform and improving how users can interact with the modules. In the previous report, the project already had three working modules, and the basic structure of the application was in place. For this phase, my goal was to continue building on that foundation and make the platform feel completer and more useful as a learning tool.

One of the biggest tasks during this period was adding more training modules. Initially, the application only included modules on Phishing Awareness, Password Security, and Social Engineering. I added three additional modules covering Multi-Factor Authentication, Safe Browsing, and Incident Reporting. Each module now follows a similar format that includes a short explanation of the topic, practical scenarios, and quiz questions. This structure helps the users first understand the concept and then, apply what they have learned in a simple activity.

Another change I worked on was improving the way the modules respond to user answers. Earlier, when someone selected an answer, the system would immediately move to the next question. While this worked technically, it didn't really help with learning because users couldn't see why their answer was correct or incorrect. And in the last meeting jack and I talked about and thought to add a note.So,I changed the module logic so that after an answer is selected, the system now shows a short message explaining whether the answer was right or wrong and why. I think this small change makes the platform more educational instead of just acting like a test.

While expanding the modules, I also ran into a few technical issues related to navigation and progress tracking. Some routes between pages were not working consistently, especially when returning to the modules page. I spent time reviewing the routing structure and updating the module configuration so the navigation works properly across the application. Fixing these issues helped make the overall flow of the platform smoother.

I also updated the dashboard to match the expanded module system. Since the project now includes six modules instead of three, the progress calculation and recommendation logic needed to be adjusted. The dashboard now shows the learner's progress more accurately and suggests which module they should complete next.

Overall, this stage of development was focused on expanding the project and making it easier to use. Compared to the previous report, where most of the work involved building the first modules and fixing early issues, this phase was more about improving the learning experience and completing the structure of the training platform. The application now feels much closer to a real cybersecurity awareness training tool rather than just a prototype.

Repo Check-In of Implementation Completed

During this reporting period, several updates were committed to the GitHub repository:

- Added three new modules: Multi-Factor Authentication, Safe Browsing, and Incident Reporting
- Expanded the training system from three modules to six modules
- Updated modulesData.jsx to include all modules and correct routing information
- Refined existing modules to include answer feedback and explanations
- Updated dashboard logic to track progress across all modules
- Improved navigation between modules and the dashboard
- Updated storage logic to handle additional module completion states

Code changes were committed regularly during development so progress could be tracked incrementally and debugging would be easier if issues occurred.

AI Use Section

AI Tool Name	Version	How It Was Used	Value Added
ChatGPT	GPT-5 (Plus Plan)	Used for debugging React routing issues, refining module logic, and helping structure explanations in the learning modules	I reviewed and modified all suggested code, integrated it with my existing project structure, and tested the application to ensure the changes worked correctly
GitHub Copilot	VS Code Extension	Provided small code suggestions while writing JSX components and repetitive UI structures	Suggestions were reviewed and edited manually before being added to the project
Grammarly	Free Version	Used to improve clarity and grammar in written documentation and reports	I edited the writing to ensure the report accurately reflects the work completed

AI tools were used only as development support tools. All implementation decisions, debugging, integration, and testing were completed manually.

Conclusion

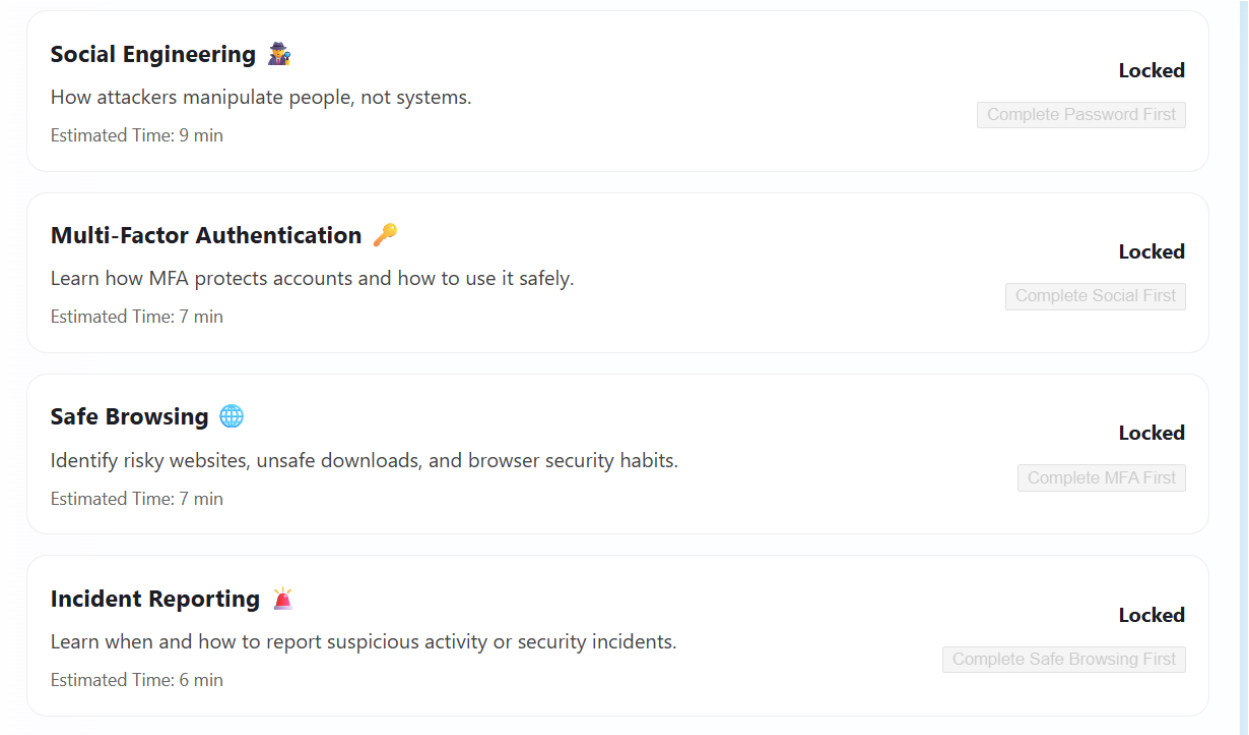
This reporting period focused on expanding the CyberAware platform and improving the learning experience for users. By adding three new modules and improving feedback within the quizzes and scenarios, the project now provides a more complete cybersecurity training path.

The most valuable improvement during this phase was adding explanations after answers in the learning modules. This change makes the application more effective as an educational tool because learners receive immediate feedback and understand why a particular answer is correct or incorrect.

In addition to adding new functionality, I also spent time fixing navigation issues and updating the dashboard so that progress tracking accurately reflects the expanded module structure. These changes improved both the reliability and usability of the application.

At this stage, the platform contains six modules and a functioning progress system. The project is now closer to a full training application rather than a prototype. The next stage of

development will focus on final refinements and improving how learner data is stored and managed through the backend.



Part 2: Spot the Phish

Read the message. Decide if it's phishing or safe.

From: Payroll Team <payroll@company-payroll-support.com>
Subject: Action Required: Confirm your direct deposit info

Hi,

Your payroll will be paused unless you confirm your direct deposit within 2 hours.

Confirm here: http://company-payroll-support.com/verify

Thanks,
Payroll Team

🚩 Phish ✅ Safe

Correct ✅

Correct. This is phishing because it creates urgency, uses a suspicious domain, and asks you to complete a sensitive action through a link.
